

WHAT IS CLAIMED IS:

1. An electronic device comprising a nonaqueous solvent battery disposed on a substrate and an electronic circuit disposed adjacent to the battery, wherein the electronic circuit is isolated from the battery by an epoxy resin composition containing:
  - (a) an epoxy resin;
  - (b) a latent catalyst consisting of a phenol compound and an organic metal compound;
  - (c) a butyral resin; and
  - (d) an inorganic filler.
2. An electronic device according to Claim 1, the average particle diameter of said inorganic filler is 10  $\mu\text{m}$  or less and the ratio of the inorganic filler in said epoxy resin composition is 10% by weight or more and 80% by weight or less.
3. An electronic device according to Claim 1, wherein said organic metal compound is a metal complex.
4. An electronic device according to Claim 1, wherein said phenol compound is a bisphenol S and said organic metal compound is made of a zirconium type compound.
5. An electronic device according to Claim 1, wherein said epoxy resin is an epoxy resin homopolymer.
6. An electronic device according to Claim 2, wherein said organic metal compound is a metal complex.
7. An electronic device according to Claim 2, wherein said phenol compound is a bisphenol S and said metal complex is made

of a zirconium type compound.

8. An electronic device according to Claim 2, wherein said epoxy resin is an epoxy resin homopolymer.

9. An electronic device according to Claim 1, wherein said epoxy resin composition covers said electronic circuit.

10. An electronic device according to Claim 1, wherein said epoxy resin composition covers said nonaqueous solvent battery.

11. An electronic device according to Claim 1, wherein said epoxy resin composition is molded into the form of a container and the container encloses said nonaqueous solvent battery.

12. An electronic device according to Claim 1, wherein said epoxy resin composition is molded into the form of a container and the container encloses said electronic circuit.

13. An electronic device according to Claim 1, wherein said electronic circuit is a control circuit for said nonaqueous solvent secondary battery.

14. An electronic device according to Claim 1, wherein said electronic circuit is a protective circuit for said nonaqueous solvent secondary battery.

15. An electronic device comprising a battery using a nonaqueous electrolyte and a battery protective circuit arranged adjacent to the battery, the battery protective circuit being coated with an epoxy resin composition containing an epoxy resin, a latent catalyst consisting of a phenol compound and an organic metal compound, a butyral resin and an inorganic filler.

16. An electronic device according to Claim 15, the average particle diameter of said inorganic filler is 10  $\mu\text{m}$  or less and

the ratio of the inorganic filler in said epoxy resin composition is 10% by weight or more and 80% by weight or less.

17. An electronic device according to Claim 15, wherein said organic metal compound is a metal complex.

18. An electronic device according to Claim 15, wherein said phenol compound is a bisphenol S and said organic metal compound is made of a zirconium type compound.

19. An electronic device according to Claim 1, wherein said epoxy resin is an epoxy resin homopolymer.
